FleetSync[™] KenCall Voice Communications Manager

FleetSync[™] KenCall provides for easy and instant control of voice communications. As transmissions are received from radios in the field they are prioritized and sequenced however the dispatcher wants to see them. One double-click automatically makes the connection to the desired radio.

Priority levels can be indicated for each radio or channel. The

priority level determines the sequence of the calls in the window. If the priority is designated to be an alarm priority, an audible and/or visual prompt is given to the dispatcher when the call comes in. Quick response to emergency situations will help protect property and improve safety for workers in the field.

FleetSync[™] KenCall gives the dispatcher powerful control to maximize productivity. Improved efficiency and better utilization of remote assets means cost savings, more revenue and higher profits for the organization.

FleetSync[™] KenCall Status and Text Messaging

11	ladio Description	Date/Time	Fleet	ID.	Picety	Sect	flead	Manage

Messaging is a powerful communications tool for fleet management. FleetSync[™] KenCall provides the ability to organize incoming messages for efficient response. A special user-defined filter allows only the desired messages to be displayed in

the window. Status messages are easily programmed. The dispatcher merely double-clicks the message to respond with a status or text message. As messages are responded to, they are tagged as read. Operation of FleetSync[™] KenCall messaging is intuitively simple while functioning as a powerful utility.

Priorities can be set for radio channel. Alarms are set by priority level OR by message text. If the status message "EMERGENCY - SEND HELP" is programmed as an alarm, when that message is received the dispatcher will be advised by audible and/or visual prompts.

Now with FleetSync[™] KenCall messaging critical information can be communicated to workers in the field to give them directions and special orders with accuracy and security. Their ability to readily respond gives the dispatcher acknowledgement that the communication was properly conveyed and understood. FleetSync[™] KenCall messaging enables the dispatcher to increase productivity of the fleet as well as improve customer service.

FleetSync™ KenCall Network Processing

Network up to 10 workstations together with FleetSync[™] Kencall. Each network client will be installed with a running program module which is configured with the network addresses of the other desired workstations. Workstations with radios attached posess full functionality to participate in voice and message communications on the system. Clients without radios attached can send and receive messages with field units and can monitor voice communications activity in the Call List Groupbox window.

FleetSync™ KenCall Networking is available in full version only
