Model 24-66
VoIP Base Remote Controller

With tons of features, stylish good looks and the famous IDA
dependability the MODEL 24-66 VoIP is destined to be a crowd
pleaser. Our newest addition joins the most extensive family of
base station remotes and panels in the world.

The 24-66 VoIP allows Remote Control of a base station radio
via an Ethernet LAN. The remote can also be connected to
a computer, which allows the computer access to the LAN
without the need for a hub. The 24-66 VoIP can also provide
Remote Control across an internet. The internet might be
composed of one or more Ethernet LANs, WANs, or the Internet

All of features of IDA’s traditional 24-66 series of Tone and
Digital Remotes and more are available with the MODEL 24-66
VoIP.

MODEL 20-28 VoIP
Termination Panel

Designed for use with the
Model 24-66 VoIP desktop
controller, the Model 20-28 VoIP
interfaces to remotely located
base stations or repeaters. Based upon proper control signals
received from the desktop controller, the Model 20-28 VoIP
directly controls the radio by either binary or serial control.

Local Option

For installations where local operation of the base station is
desired, the 20-28 VoIP is available with desk microphone,
speaker jack and volume control. (Option RTM-604)

Features & Capabilities

• Handset or desk mic
• Up to 99 channels
• Intercom
• Mute
• Clock
• VU meter
• Alpha-numeric display
• 110 or 15 volt operation
• US or European power supply

OPTIONAL FEATURES

• One touch transmit
• Wall mount
• Headset and footswitch

Model 24-66 VoIP Specifications

Input voltage.......................................................... 15Vdc @ 1000mA
24 Watt Wall Transformer
2.1 x 5.5mm barrel conn. Center (+)

Current consumption @ 15Vdc................................. 450 mA (TX)
800 mA (RX)
400 mA (STBY)

Standby voltage......................................................... 15 Vdc

Temperature range.................................................. 0 to +60° C

Relative humidity...................................................... 90% at 50° C

TX hum & noise...................................................... -60 dB (ref. +0 dBm)

Threshold of compression......................... -20 dBm adjustable (speaker audio)

Speaker audio output.............................. 3W into 4 ohms

Distortion (at rated speaker output)......................... < 3%

RX hum & noise.................................................. -47 dB (ref 0dBm)

Frequency response .................................... +1, -3 dB (300 to 3000 Hz)

TX Compression............................................... With an audio increase of 30dB beyond the start of compression
the output increases 17.5dB

Ethernet Interface........... The Ethernet Interface consists of a three port switch. One port connects externally to the LAN, the second port connects externally to a computer to allow the computer access to the LAN, the third port connects internally to the Ethernet port of the NET+ARM MCU.

DSP Firmware .................. The DSP firmware provides the following standard CODEC algorithms:
G.711, G.723.1, G.726.

Weight............................................................. 4 lb. 15 oz.

Dimensions..................................................... 4.75” (h) x 8” (d) x 10” (w)

Overview
The basic function of the voice over IP (VoIP) radio control system is to allow a private mobile radio base station to be controlled from a remote location. The system consists of a base station radio, a panel and a remote. The panel connects to the radio and provides direct control of the radio based upon control signals from the remote. The panel also has access to the radio’s receive and transmit audio which is passed to and from the remote. The panel and the remote are connected by means of an IP network. This system will allow a user of the remote to change the current radio channel and select other radio functions in much the same way as can be done directly at the radio. The user of the remote can also carry on voice conversations with mobile radio users through the base station radio.

Basic Setup
The basic VoIP radio control system is depicted in Figure 1. The remote and the panel are connected via an Ethernet LAN. If desired, the VoIP remote can also be connected to a computer which allows the computer access to the LAN without the need for a hub, thus eliminating the need for separate cabling.

Extended Setup
An extended VoIP radio control system is depicted in Figure 2. Here, multiple remotes connect to the panel across an internet. The internet might be composed of one or more Ethernet LANs, WANs or the Internet.
